

Why is this extension not in the TER?

I just don't like the user handling and all the pain stuff that is necessary to publish an extension into the official TYPO3 extension repository (TER). I prefer to use a more collaborative platform like GitHub and tools like composer (which plays nice with GitHub repos). The TER-way of extension ownership and publishing is not so fluent and easy and the whole infrastructure of GIT and gerrit in the TYPO3 domain is not really inspiring to collaboration in my eyes. But this is just my opinion and if you feel like adding this into TER, you may.

So please feel also free to fork this extension and send pull requests if you feel like this can be improved (code as well as documentation).
